

## Product Information

### Lectin from *Triticum vulgaris* TRITC Conjugate

Product Number **L 5266**  
Storage Temperature 0 °C

#### Product Description

At low pH (below pH 3), this lectin is a monomer (17 kDa by sedimentation velocity). However, it is a dimer (35 kDa by sedimentation velocity) at neutral to slightly acidic pH.<sup>1,2</sup> By SDS-PAGE analysis, the monomer migrates as an 18 kDa protein.<sup>3</sup>

The absorption maximum ( $\lambda_{\max}$ ) for the native dimer is 272 nm with a molar extinction coefficient ( $E^M$ ) of  $1.09 \times 10^5$ . The pI varies by lectin isoform (isoelectins I, IIa, III - pI = 8.7 +/- 0.3 and isoelectin IIb - pI = 7.7 +/- 0.3).<sup>4</sup>

Lectins are proteins or glycoproteins of non-immune origin that agglutinate cells and/or precipitate complex carbohydrates. Lectins are capable of binding glycoproteins even in presence of various detergents.<sup>5</sup> The agglutination activity of these highly specific carbohydrate-binding molecules is usually inhibited by a simple monosaccharide, but for some lectins, di, tri, and even polysaccharides are required.

Lectins are isolated from a wide variety of natural sources, including seeds, plant roots and bark, fungi, bacteria, seaweed and sponges, mollusks, fish eggs, body fluids of invertebrates and lower vertebrates, and from mammalian cell membranes. The precise physiological role of lectins in nature is still unknown, but they have proved to be very valuable in a wide variety of applications *in vitro*, including:

1. blood grouping and erythrocyte polyagglutination studies.
2. mitogenic stimulation of lymphocytes.
3. lymphocyte subpopulation studies.
4. fractionation of cells and other particles.
5. histochemical studies of normal and pathological conditions.

Sigma offers a range of lectins suitable for the above applications. Most Sigma lectins are highly purified by affinity chromatography, but some are offered as purified or partially purified lectins, suitable for specific applications.

Many of the lectins are available conjugated to (conjugation does not alter the specificity of the lectin):

1. fluorochromes (for detection by fluorimetry).
2. enzymes (for enzyme-linked assays).
3. insoluble matrices (for use as affinity media).

Please refer to the table for general information on the most common lectins.

The inhibition of agglutination activity by di-N-acetylglucosamine (GlcNAc)<sub>2</sub> on this wheat germ lectin is reported to be approximately 600 times greater than that of N-acetylglucosamine (GlcNAc). Tri-N-acetylglucosamine (GlcNAc)<sub>3</sub> is reported to be about 3000 times more inhibitory than GlcNAc.<sup>6</sup>

This product is conjugated to TRITC, allowing fluorescent detection in binding assays.

#### Precautions and Disclaimer

For Laboratory Use Only. Not for drug, household or other uses.

#### Preparation Instructions

This lectin is soluble in phosphate buffered saline, pH 7.2 (1 mg/ml).

The maximum solubility in 1 mM Tris-HCl, pH 7.4, is reported to be approximately 1 mg/ml. Solubility is greatly increased at low pH (maximum solubility in 0.1 M acetic acid is >10 mg/ml).<sup>7</sup>

#### Storage/Stability

Aggregation is thought to occur in the presence of high concentrations of 2-mercaptoethanol.

Lectin	MW (kDa)	Subunits	Specificity		Mitogenic Activity
			Blood Group	Sugar	
<i>Abrus precatorius</i>			–		+
Agglutinin	134	4		gal	
Abrin A (toxin)	60	2		gal	
Abrin B (toxin)	63.8	2( $\alpha\beta$ )		gal	
<i>Agarius bisporus</i>	58.5	–	–	$\beta$ -gal(1 $\rightarrow$ 3)galNAc	
<i>Anguilla anguilla</i>	40	2	H	$\alpha$ -L-Fuc	
<i>Arachis hypogaea</i>	120	4	T	$\beta$ -gal(1 $\rightarrow$ 3)galNAc
