

## 50875 GSP Agar

### (*Pseudomonas Aeromonas Selective Agar acc. to Kielwein, Glutamate Starch Phenol Red Agar*)

For the detection of *Pseudomonas* and *Aeromonas* in food, as well as in the equipment and water supplies of food-processing firms.

#### Composition:

Ingredients	Grams/Litre
Sodium L-glutamate	10.0
Starch (soluble)	20.0
Potassium dihydrogen phosphate	2.0
Magnesium sulfate	0.5
Phenol red	0.36
Agar	12.0
Final pH 7.2 +/- 0.2 (at 25°C)	

Store prepared media below 8 °C, protected from direct light. Store dehydrated powder in a dry place in tightly-sealed containers at 2-25 °C.

#### Directions:

Dissolve 44.86 g in 1 litre distilled water and sterilize by autoclaving at 121 °C for 15 minutes. Cool to 45-50 °C and add 100 IU/ml penicillin G (Cat. No. 13752) and, if desired, 10 µg/ml pimaricin (Cat. No. P0440). Mix well and pour into sterile petri plates.

#### Principle and Interpretation:

Glutamate and starch are the sole sources of nutrients in GSP agar. Many microorganisms cannot metabolize these compounds<sup>5</sup>. Starch is degraded by *Aeromonas* with the production of acid and causes phenol red to change color to yellow. *Pseudomonas* grow luxuriant on this medium but do not degrade starch. Selective inhibitors like penicillin and pimaricin are added to the medium to suppress the growth of many Gram-positive organisms and fungi.

Cultural characteristics after 24-48 hours at about 28 °C.

Organisms (ATCC)	Growth	Starch hydrolysis (color change from red-violet to yellow)
<i>Aeromonas hydrophila</i> (7966)	+++	+
<i>Pseudomonas aeruginosa</i> (27853)	+++	-
<i>Escherichia coli</i> (25922)	-/+	-
<i>Staphylococcus aureus</i> (25923)	-	-
