

Battery Recycling

Cover Regulations, Recover Resources

Closing the gap in the battery lifecycle

Battery recycling is one of the major environmental challenges of our time. Different treatment stages during the recycling process use water to cool, wash, and dissolve components, resulting in

wastewater that contains hazardous substances. The discharge poses a significant risk for the ecosystem and must undergo treatment in accordance with local regulations. But it also holds valuable raw materials, which could be reused in the production of new batteries, thus reducing extraction of new materials. Detecting both risks and resources requires accurate wastewater testing.

Spectroquant® wastewater monitoring system

Whether for regulatory compliance or resource recovery, discharge water at battery recycling sites must be tested for several key parameters. While complex methods like AAS and GC-MS are sometimes used, the Spectroquant® system presents a convenient, all-in-one solution with every component required for swift, secure photometric analysis of wastewater.

- **Prove plus spectrophotometers** offer intuitive controls and pre-programmed methods for analysis of over 200 test kits
- **Ready-to-use test kits for key parameters** in reagent or cell formats are supplied or pre-filled with all reagents needed
- **Start-to-finish analytical quality assurance (AQA)** supported by detailed certificates of analysis (CoA)
